Reporting on a Computer: Using Reporting Programs One of the best ways to report on a computer is to report what the program is doing. My favorite program to use is Microsoft's free Windows' Task Manager, which tracks processes going on in your system at any given time. **Using Windows' Task Manager** To access the Windows Task Manager (see Figure 10-3), click the Windows button and choose the Start menu option to open the Start menu. The Start menu lists programs in order of their activity or priority. Click the Task Manager item under the Programs heading. ****Figure 10-3:**** If you wish, you can track the memory usage of several programs at once. The Task Manager automatically updates as programs run or stop, depending on the priority assigned to them in Windows' start-up process. Click the Processes tab and you see a list of all running programs, sorted by priority. Click any program to see information about it. If you feel overwhelmed, you can add more columns with more statistics; click the Columns link, then select Statistic from the list. In the new column, you can choose to display the Start Time, End Time, CPU Time, MEMORY, Physical Address, Bytes of Data and PID of the process. These tasks will not slow the computer down: Updating the Task Manager's screen refresh rate is not recommended. You should not use more than one or two columns. Anything more than that is unnecessary and distracting. (In other words, you're better off exploring each program with more detailed examination.) The CPU Time and MEMORY columns provide somewhat useful information, but you should use any of the processes' other statistics instead. To switch from one program to another, simply click its button or icon in the left-hand column of the Task Manager window. Scroll down the list to display more programs and click icons or buttons to switch to those programs. **Playing Around with Software** It's fun to play with the programs you use. Not only will you learn more about them, but you'll also see how they behave and whether they can be used to create graphics that really make your story. Keep in mind that every program is different, but the more you use it, the more familiar you'll become with it.

Efficient Editing Tools Photoshop Elements has all of the standard tools for image editing as well as many additional tools to make the user experience more efficient. **Layers** Layers allow you to edit images in easy to use steps. You can apply one effect or a combination of effects to layers. You can apply effects to the entire image or you can apply them to parts of the image through masking. **Masking** Masking allows you to select an area of an image and replace the selected area with other information or with a different image. You can mask parts of images, replace parts of images and replace the entire image. You can apply images to a layer as a mask, make a selection of an image and place it over a layer as a mask, or merge several layers together using a mask. **White Balance** The White Balance tool allows you to change the white balance of a picture through the four primary white balance adjustments. The four white balance adjustments include auto, incandescent, tungsten, and fluorescent. You can apply a single white balance adjustment to a picture or you can group multiple white balance adjustments and apply them to a picture. **Color** The Color tool allows you to adjust the overall color of an image or to adjust the color of selected areas of a picture. You can change the brightness or the saturation of the entire image or of the entire image except a specific selection. The Color Profile tool allows you to change the color profile of a photo. You can apply a color profile to the entire photo, or you can add color profiles to a selection, directly on a layer, or on a mask. You can apply a different color profile to a selection, on a layer, or on a mask. **Adjustment Layers** The Adjustment Layers tool lets you apply multiple adjustments at the same time. You can apply up to twenty adjustments at once. In addition to applying adjustments to a single

layer, you can apply adjustments to the entire image. The Adjustment Brush tool lets you apply adjustments directly to a selection, to a group of selected areas, or to the entire image. You can also copy and paste adjustments. Liquify The Liquify tool allows you to change the way an image is displayed in the Photo Editor by smoothing, distorting, or warping the image. There are three types of distortion 05a79cecff

Q: phpMyAdmin SQL not working with Onepage Checkout I'm currently using onepage checkout in the checkout process. Once I try to access phpMyAdmin it sends me to a completely blank screen with a red X in the top left corner. If I disable onepage checkout it works fine. My store has been set to allow cart editing on the backend. I've already checked that the "Allow External Stores to Edit" option is off. Any ideas? A: Sounds like a permissions issue. Please try a.) Go to /wp-admin/ b.) Edit the file to allow your specific user to access it. Either find: /files/users-edit.php /files/users-edit.php?action=edituser or at the bottom of the page: \admin\edituser.php \admin\edituser.php?action=edituser and add your users permissions. For example if you have a role called Store Managers, add public function validateUser() { if (get_current_user_id() === get_option('admin_email')) return; if (! current_user_can('manage_options')) return; // Ensure this user is authenticated before continuing if (is_user_logged_in()) return; // Hook this to check if the user is trying to access a page they have no access to \$this->validateUserPermissions(get_current_user_id()); if (\$this->validation->passed()) return; die(wpautop(__('Sorry, you are not allowed to access this page.'))); } To: public function validateUser() { if (get_current_user_id() === get_option('admin_email')) return; if (! current_user_can('manage_options'))
