

energy and power technology department at c.i.t. campus. c. campus offers a career opportunities for students who are pursuing their masters in energy and power technology. the department aims to train students with the skills that they can offer to the industry. further, they are given the opportunity to work on the research related to the energy and power technology. campus is the one of the best institute in energy and power technology. it is a state of art institute in energy and power technology. energy technology department at c.i.t. campus. c. campus offers a career opportunities for students who are pursuing their masters in energy and power technology. the department aims to train students with the skills that they can offer to the industry. further, they are given the opportunity to work on the research related to the energy and power technology. campus is the one of the best institute in energy and power technology. it is a state of art institute in energy and power technology. to get energy from wind, the power developed by a wind turbine, has to be converted to electricity, which is done by a power converter (typically a generator). generators use either synchronous or asynchronous converters to convert the power from the rotating turbine into electricity. a synchronous generator can be connected directly to the grid, while an asynchronous generator needs to be connected to a power converter to operate in synchronism with the grid. most power converters are designed to be able to withstand the very high voltages used in power transmission.

in this paper, we explore the use of the united states department of energy (doe) complex simulation models of the performance of the energy efficiency and renewable energy systems market for residential, commercial and industrial buildings. in particular, we highlight the following features of these models: design solution: design energy efficient refineries for optimum production of refineries. scope of the project will be to analyze the existing refineries and provide the most effective and efficient design solutions to maximize production and utilization of the process equipment in refineries. the project will include comprehensive literature review, identification of key processes in the refinery operations, based on the material flow analysis, flow diagram, process equipment analysis, equipment selection and performance evaluation. the results will be presented in the form of a comprehensive report and design document. energy sources: various sources of energy are available such as solar energy, wind energy, biomass energy, geothermal energy, nuclear energy, hydro energy, etc. a major portion of the world's population is without power and yet a large number of people depend on these renewable sources of energy to meet their energy needs. each energy source has its own advantages and disadvantages. the study of each energy source will help us to understand the source of energy and the ability of human to utilize each source. the present study is carried out to evaluate, analyze, simulate and discuss the major energy sources such as solar energy, wind energy, biomass energy, geothermal energy, nuclear energy, hydro energy, etc. and their pros and cons.
