occasionally crack can be purchased in rock form, but when the drug is cooked into freebase, the high is weaker, lasting anywhere from three to six hours rather than around an hour for powder, he said. but when the cocaine is cooked, the drug may stay in the user's stomach or intestines for up to 24 hours. this makes it much more addictive than other drugs, such as nicotine, since it takes more time to get out of the user's system. a better analogy, though, is that of a hot tub. this analogy also explains why those who use the drug often describe a similar feeling to that of being high when they first use cocaine. but even though crack is cooked differently from powder cocaine, many users who begin using crack initially feel similarly to how they did with cocaine powder, and the high is not always much stronger than the powder high, said dr. palamar. the differences in the high can explain why, in terms of illicit drug usage, crack users are considerably more likely to feel compelled to use more of the drug later, than users of cocaine powder. they are also more likely to commit crimes like robberies to obtain money to buy more of the drug, and they are more likely to use the drug in more dangerous ways--using the drug in places where they are more likely to be observed and arrested, like in the woods and at parks, dr. palamar said. a third important difference between crack and powder cocaine is its effect on the heart and brain, explained dr. palamar. the cocaine high is similar to one from anabolic steroids, which have, for example, been linked to a greater risk of blood clots and heart attacks. these are the same two main reasons why smoking, snorting, injecting, and swallowing cocaine can be dangerous to one's health, he said.

conclusions: according to the majority of studies included in this review, crack use is associated with a higher risk of adverse psychological outcomes. greater adverse psychological effects were reported for crack compared with powder cocaine. alcohol use is also associated with higher risk of adverse psychological outcomes, and as crack use is associated with increased alcohol use, it is likely that greater adverse psychological effects are associated with crack use. future research needs to address whether the findings in the included studies are comparable or can be generalised to other subgroups. comments: this review is an important addition to our understanding of the extent and nature of health effects associated with crack use. the authors have identified gaps and shortcomings in our current understanding of the possible associations between crack-cocaine use and adverse health effects. the reviewed studies were published from 1996 to 2016 and were predominantly conducted in the us. health outcomes were measured in multiple ways, but the majority of the studies used self-reported health outcomes. recommended revision: the authors have appropriately recognised the need to conduct additional research using more representative samples of crack cocaine users. crack-cocaine users may be a unique population when compared to other cocaine users, and there is a need for more research on the profile and health effects of this population. as such, studies conducted in the us need to be updated and replicated in other populations. the authors have included potential biases that may influence the findings reported in the studies. some measures of drug use such as self-reported negative health outcomes and measurement periods may be subject to recall and social desirability biases. it is important to acknowledge potential health biases in these studies and adjust for these limitations. the authors have appropriately acknowledged the need for more qualitative research into the connection between crack cocaine use and health. this is an essential research gap that needs to be addressed. 5ec8ef588b
